

"Deluxe" Practical Training at Osteology in Monaco

Intensive practical training is a hallmark of the Osteology congress series. Almost 20 practical workshops will again be inviting attendees to learn regenerative therapies from the world-class specialists and acquire their own experience at the major International Symposium in Monaco, May 2-4, 2013.

Regenerative therapies require a high degree of dexterity – from the first incision to the last suture. Anyone wanting to remain up to date is dependent on regular practice and trial, because the repertoire of therapies is constantly being supplemented by new techniques and materials. Thus, the Osteology Foundation clearly focuses on hands-on training at all symposia it organizes.

Once again on May 2, 2013, the pre-symposium day of the International Osteology Symposium, 17 practical workshops in German, English and French will be inviting attendees to train their own skills.

A whole day concentrating on practice

"Decision making with oral tissue regeneration" is the symposium's main topic. Top speakers from all over the world will be spending two days presenting and discussing the current state of knowledge relating to regenerative therapies. However, the day prior to the congress is dedicated solely to practice. The Osteology Foundation alone is organizing seven practical and two theoretical workshops. Further there are eleven workshops being organized by the Gold Partners viz., BioHorizons, Camlog, Dentsply Implants, Geistlich Biomaterials, Nobel Biocare and Straumann.

"Hands-on" is the motto in almost 20 workshops

Procedures for both bone and soft tissue regeneration and the topic of peri-implantitis are at the core of the practical exercises. Using pig's jaw models, attendees can gradually learn flap formation, incision types and suture techniques, practice widening up of keratinised mucosa, perform vertical and horizontal bone augmentation, practice ridge preservation combined with socket seal or try out various surgical and non-surgical

procedures for peri-implantitis treatment. The clear objective of the workshops is to teach attendees current therapy concepts and give them practical tips for everyday dental practice.

Workshops for researchers

The Osteology Foundation is also proud to premier workshops for researchers. Two theoretical workshops will deal with the experimental evaluation of biomaterials and the correct selection of models for translational research.

Overview of the key workshop topics:

- Bone regeneration, vertical and horizontal augmentation
- Ridge preservation after tooth extraction
- Plastic-aesthetic periodontal surgery
- Soft tissue management with established and innovative materials
- Peri-implantitis: prevention, diagnosis and therapy
- Flap formation, incision type and suture techniques subject to indication
- Assessment of biomaterials and models for translational research

The congress website: www.osteology-monaco.org lists the congress programme and all workshops including details of the speakers, languages, etc. You can register online via the congress website or by fax (+377 97 97 35 50). Needless to emphasize your prompt action as the number of places in every workshop is limited.
